

Book Recommendation App (HTML, CSS & JavaScript)

This project helps students learn:

- HTML structure
- CSS styling
- JavaScript interaction
- Arrays and objects
- Event handling

By the end, you will have a simple app where users choose a genre and get book recommendations.

Step 1: Create Your Project Folder

Create a folder called:

book-recommendation-app

Inside it, create 3 files:

index.html

style.css

script.js

Your folder should look like this:

book-recommendation-app

```
|
|— index.html
|— style.css
|— script.js
```

Step 2: Write the HTML

Open `index.html` and add this code:

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width,
initial-scale=1.0">
  <title>Book Recommendation App</title>

  <!-- Connect CSS -->
  <link rel="stylesheet" href="style.css">
</head>
<body>

  <div class="container">
    <h1>&img alt="book icon" data-bbox="238 438 258 453"/> Book Recommendation App</h1>

    <p>Select your favorite genre:</p>

    <select id="genre">
      <option value="">-- Choose Genre --</option>
      <option value="adventure">Adventure</option>
      <option value="science">Science</option>
      <option value="history">History</option>
      <option value="fantasy">Fantasy</option>
    </select>

    <button onclick="recommendBook()" >
      Recommend Book
    </button>

    <div id="result"></div>
  </div>

  <!-- Connect JavaScript -->
  <script src="script.js"></script>

</body>
</html>
```

What This HTML Does

- Creates a heading
- Creates a dropdown menu
- Creates a button
- Creates a place to display results

Step 3: Add CSS Styling

Open `style.css` and add:

```
body {
  font-family: Arial, sans-serif;
  background-color: #f4f4f4;
  text-align: center;
  padding: 40px;
}

.container {
  background: white;
  padding: 30px;
  width: 400px;
  margin: auto;
  border-radius: 10px;
  box-shadow: 0px 0px 10px gray;
}

h1 {
  color: darkblue;
}

select, button {
  padding: 10px;
  margin-top: 15px;
  width: 80%;
  font-size: 16px;
}

button {
  background-color: darkblue;
  color: white;
  border: none;
```

```
        cursor: pointer;
    }

    button:hover {
        background-color: blue;
    }

    #result {
        margin-top: 20px;
        font-size: 18px;
        color: darkgreen;
    }
}
```

What This CSS Does

- Adds colors
- Centers the app
- Styles the button
- Makes the app look modern

Step 4: Add JavaScript

Open `script.js` and add:

```
function recommendBook() {

    // Get selected genre
    let genre = document.getElementById("genre").value;

    // Create result variable
    let recommendation = "";

    // Check genre and recommend books
    if (genre === "adventure") {
        recommendation = "Recommended Book: Treasure Island";
    }

    else if (genre === "science") {
        recommendation = "Recommended Book: A Brief History of Time";
    }
}
```

```
else if (genre === "history") {
    recommendation = "Recommended Book: Long Walk to Freedom";
}

else if (genre === "fantasy") {
    recommendation = "Recommended Book: Harry Potter";
}

else {
    recommendation = "Please select a genre.";
}

// Display recommendation
document.getElementById("result").innerHTML = recommendation;
}
```

What This JavaScript Does

- Reads the selected genre
- Uses `if` statements
- Displays a recommendation

Step 5: Run the App

1. Save all files
2. Open `index.html`
3. Choose a genre
4. Click the button

You will see a recommended book.

Final Output

Your app will:

- Let users choose a genre
- Recommend a book
- Display the result instantly

Step 6: Upgrade the App (Optional)

You can improve the project by:

- Adding book images
- Adding more genres
- Using arrays and objects
- Making random recommendations
- Adding dark mode

Example Using Arrays and Objects (Advanced)

Replace your JavaScript with this:

```
const books = {
  adventure: [
    "Treasure Island",
    "Robinson Crusoe"
  ],

  science: [
    "A Brief History of Time",
    "The Science Book"
  ],

  history: [
    "Long Walk to Freedom",
    "Sapiens"
  ],

  fantasy: [
    "Harry Potter",
    "The Hobbit"
  ]
};

function recommendBook() {

  let genre = document.getElementById("genre").value;

  if (genre === "") {
```

```
document.getElementById("result").innerHTML =  
    "Please select a genre.";   
    return;  
}  
  
// Get books from selected genre  
let genreBooks = books[genre];  
  
// Random book  
let randomIndex = Math.floor(Math.random() * genreBooks.length);  
  
let selectedBook = genreBooks[randomIndex];  
  
document.getElementById("result").innerHTML =  
    "Recommended Book: " + selectedBook;  
}
```

Concepts Learned

You practiced:

- HTML elements
- CSS styling
- JavaScript functions
- Variables
- Arrays
- Objects
- Random selection
- DOM manipulation

Challenge for Students

Try adding:

1. A new genre
2. At least 3 books per genre
3. A book cover image
4. A rating system
